

The radiation emissions as they are now from cell phone towers are much too high. Many people are completely severely affected and have been suffering effects from this for years and have had no place safe to live. 4% of the population cannot live in homes near cell towers; 35% - 40% feel the effects severely. The effects include inability to live and remain in a home where cell towers are, a lack of physical balance, radiation illness, radiation burns on the skin, nausea, continuous burning pain in the ears and on the outer ears which pick up a frequency, electrical shocks, burning pain in the neck and back, vision problems, migraines, extremely high blood pressure, extremely fast heart beat, CANCER, BRAIN TUMORS as well as genetic changes. Also pets living in homes with cell towers are severely affected developing cancer and brain tumors.

Many people cannot be near towers or other peoples' cell phones, cannot travel in public transportation or partake in public activities. The effects also include extra sensitivity to electrical appliances and medical machineries. This means an electrically sensitive or magnetically sensitive person will have an adverse reaction to heart testing, monitors, and MRIs which could be very harmful in an ER situation. A medical protocol and an awareness is needed to keep cell phones and wireless away from these people in regular daily life and as patients. Migratory birds lose their sense of direction. Bees are not pollinating. The extreme weather patterns we have been enduring are in part due to the frenetically fast changes in magnetic fields produced by so many wireless products on all the time.

There should be no emissions at all, no towers at all, but if there must be some they must be set for biological safety which is much lower than at present. This is for all wireless, including towers and cell phones and wifi. Also it should be legally required to notify all tenants in a building where cell phone towers will be placed or where a nearby tower will be placed to any residents, or have already been placed, how many towers, in what direction, what kind of equipment, what company, phone address and contact no of company that has placed them there and when they have started to be turned on. And the frequencies must be monitored all the time. Smart meters are causing fires and exploding gas. They should be eliminated completely. Towers should not be allowed closer than 2 miles to any school and should not be on rooftops of buildings where people reside or are patients. Wi fi should not be used to replace all regular previous phone booths and should not be placed on buildings where tenants live. Voice over protocols to use doorbells through the phone should be eliminated. Use analog regular door bells only. The constant radiation through all these wireless devices is affecting adversely our hearing.

There should be doctors who are radiation experts, and a medical protocol developed. Electrical/magnetic sensitivity IS A DISABILITY AND SHOULD BE MEDICALLY DIAGNOSED AS SUCH AND BE PART OF THE FEDERAL PROGRAM FOR ACCOMODATION FOR DISABILITY. There should be separate communities and buildings set up in every city for electrically sensitive people without any towers or cell phones nearby. The over production and constant emersion of

radiation affects adversely the health of people, plants, and animals and is changing the Earth's magnetic field.

We need places without any towers or cell emissions at all, and much lower emissions all around on all other towers, wi fi, cell phones and all wireless products.

We also need choices to use analog or non wireless products in daily life to remain healthy able citizens in our beloved democracy.

The FCC should insure that EMR levels to which people are exposed are significantly lowered. The present levels were based on an error-it had been thought that damage was done due to heating effects so that if the heat was negligible the level was safe. Actually much lower levels cause errors in cell replication by interfering with DNA controlled molecular movement i.e.levels way below the heating level cause cancer.

Prof. J.H. Levitt Former Chair, Engineering in Medicine & Biology Society, New York Chapter, part of the non-profit I.E.E.E.

I also learned that the FCC had just issued regulations setting public exposure limits for microwave radiation at levels at least ten thousand times higher than levels which, according to the Environmental Protection Agency, were causing reports of illness from all over the world. 11/27/2012 Fire captain finds hazardous power surges follow Smart Meter installations

Matt Beckett, a CA Fire captain stated, "Two years ago PG&E replaced that meter [analog] with a Smart Meter". Immediately following we noticed power surges in the form of our refrigerator motor intermittently speeding up simultaneously with our lights becoming brighter. As a seventeen year veteran and current Fire Captain this caused me to become very concerned." The Smart meter on his house was replaced with an analog, and there were no problems, until a new Smart Meter was reinstalled. This time he had two surge protectors burn out. Read more:

11/29/2012 Examiner: Something is still wrong with the smart meters Writer Norman Lambe outlines his concerns regarding smart meters and gas explosions. "A glitch in the construction of the meters soon became apparent to the installers, and created a situation in which arcing could take place creating a spark, and if a natural gas leak existed anywhere in the vicinity serious problems could result, as witnessed to by the San

Bruno explosion." He calls for a federal probe on the possible connection between Smart Meters and

gas explosions stating, "I believe it is time for a federal probe into finding out once and for all the responsibility for the natural gas explosions taking place to determine if the smart meters are responsible."

Three states utility regulators investigating Smart Meter fires

The Pennsylvania Utilities Commission wants more information about PECO Energy's handling of its smart meter program, including failure rates of its meters, the number of overheating incidents and how many overheating incidents resulted in damage.

Regulators in other states, including Illinois and Maryland, are investigating allegations of dangerously overheating electric smart meters and reports of meter fires.
